The suffix '.fwd' indicates a forward sequencing read of the insert. It does not necessarily reflect the orientation of the insert.

/note="Torgan: Root; Vector: pSL1180, Site 1: EcoRI;
Site 2: XhoI; The library was prepared from polyA+ RNA
from the roots of 1-year-old loblolly pine (Pinus taeda)
cuttings that were rooted and then planted in washed sand.
The rooted cuttings were maintained for 139 days (July 28
2003 harvest) under ambient conditions in a local
2003 harvest) under ambient conditions in a local
greenhouse. They were kept on a weekly regimen of 0.5x
nutrient-complete Hoagland's solution and supplemented
with additional water sufficient to maintain a 15% soil
moisture content. Starting five weeks prior to harvesting
roots for mRNA preparation, the weekly fertilizer regimen
for the potted trees was modified to omit phosphorus from
the 0.5x Hoagland's solution (5 applications). For two
days prior to starting the modified fertilizer regimen,
pots were flushed extensively with water to reduce
residual levels of phosphorus. Double-stranded cDNA was
cloned unidirectionally into pSL1180. Inserts can be
excised with EcoRI (5' end) and XhoI (3' end)."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ROOCE

/note="Vector: pBRcDNASfiAB; The library was constructed from 10 different sources of RNA from a single genotype. Separate cDNAs were generated using primers that incorporated unique 5' and 3' tags to distinguish each source of RNA. cDNAs were then pooled, size-fractionated, directionally cloned into a custom medium-copy vector and transformations made with four size classes to minimize size bias. Details of each source of RNA and library directionals.

/note="Vector: pBRcDNASfiAB; The library was constructed from 10 different sources of RNA from a single genotype. Separate cDNAs were generated using primers that incorporated unique 5' and 3' tags to distinguish each source of RNA. cDNAs were then pooled, size-fractionated, directionally cloned into a custom medium-copy vector and transformations made with four size classes to minimize size bias. Details of each source of RNA and library construction can be obtained at http://cgpdb.ucdavis.edu/TAG_TISSUBschemical induction

/(clone lib="Vector: pBRcDNASfiAB; The library was constructed from 10 different sources of RNA from a single genotype.
Separate cDNAs were generated using primers that incorporated unique 5' and 3' tags to distinguish each source of RNA. cDNAs were then pooled, size-fractionated, directionally cloned into a custom medium-copy vector and transformations made with four size classes to minimize size bias. Details of each source of RNA and library construction can be obtained at http://cgpdb.ucdavis.edu/TAG_IISUE=leaves dark grow

              /clone lib="Xenopus laevis gastrula non normalized"
/note="Vector: pBluescript SK-; Site 1: EcoRI; Site 2:
XhoI; cDNA was prepared from 2 ug of poly A+ RNA (equal parts from stage 10.5 and stage 11.5 gastrulae).
EcoRI-XhoI cut cDNA was then ligated into UniZap-XR (Stratagene) with EcoRI at the 5' end and XhoI at the 3' end. The library was mass excised and used to infect Top10F'. Clones were picked into freezing medium (per liter 15 g tryptone, 10g yeast extract, 5g NaCl, 36 mM (X2HPO4, 13.2 mM KH2PO4, 17.7 mM Na-citrate, 0.4 mM MgSO4 7 H2O, 6.8 mM (NH4)2SO4, 4 % w/v glycerol) and grown for 24 hours. Original library construction by Bruce Blumberg (Cho et al 1991 Cell 67, 1111-1120)."

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     DNA Sequencing: DOB Joint Genome Institute: http://www.jgi.doe.gov Clone Distribution: I.M.A.G.E. Consortium/LLNL: http://image.llnl.gov http://image.llnl.gov Naming Conventions: EST name is generated by the concatenation of the JGI Clone Id and the direction of sequencing. The suffix '.fwd' indicates a forward sequencing read of the insert. It does not necessarily reflect the orientation of the insert. Plate: CANN 0005 row: p column: 14 High quality sequence stop: 684.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            University of California, Berkeley:

Naming Conventions: BST name is generated by the concatenation of the JGI Clone Id and the direction of sequencing. The suffix '.fwd' indicates a forward sequencing read of the insert. It does not necessarily reflect the orientation of the insert.

/notes**Vector: pHOS2; Site_1: BstXI; Total genomic DNA was isolated from early log phase trophozoites of E. invadens isolated from early log phase trophozoites of E. shotgun IP-1 using a Qiagen plant DNA extraction kit. A shotgun medium-size plasmid library (average insert size of 10 - 12 kb) was generated by random mechanical shearing of E. invadens genomic DNA, repairing the ends of DNA fragments with T4 Polymerase, adding BstXI adaptors and lighting into the BstXI site of a pUC-derived vector pHOS2."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Brendan Loftus

Details of each source of RNA and library construction can be obtained at http://cgpdb.ucdavis.edu/

This GSS is part of a random genomic sequencing program of thirteen
yeast species: Saccharomyces bayanus var. uvarum, Saccharomyces
exiguus, Saccharomyces servazzii, Zygosaccharomyces rouxii,
Saccharomyces kluyveri, Kluyveromyces thermotolerans, Kluyveromyces
lactis var. lactis, Kluyveromyces marxianus var. marxianus, Pichia
angusta, Debaryomyces hansenii var. hansenii, Pichia sorbitophila,
Candida tropicalis and varrowia lipolytica. Genomic inserts of 3 to
5 kb were prepared and both extremities were sequenced. See
keywords for description of this sequence and for the sequence of
the other extremity of this insert.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    248

/note="Vector: pAMP1; Site_1: EcoR1; Site_2: Not1; First
strand_cDNA synthesis was primed_using_oligo-dT on
magnetic_beads with an additional primer
5'-gcggccgctaatacgactcactatag-3' and
5'-gcggccgctaatacggactcactatag-3' and
5'-aagcagtggtaacaacgcagagtacttt-tttttttttvn-3'. cDNA
was subsequently_amplified in a 7-cycle PCR with the
following primers: 5'-ggccgctaatacgactcactatag-3' and
5'-aagcagtggt-aacaacgcag. Deoxy-UMP adaptors were added in
a third PCR (5 cycles) and the primers
5'-cuacuacuacuaaagcagtggtaacaacgcagagstec-3'. Ends were
treated with uracil DNA glycosylase and product with 3'
overhangs was annealed to complementary ends of pAMP1.
Insert can be excised using EcoR1 and Not1. Library
constructed by Joe Barnes and Steve Johnson (Washington
University)."

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                문
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      5
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            rapiliomavirus (HPV) Type 16 and/or 18 (but not Types 6, 11, 31, 33, 35, 39, 45, 51, 52, or 58) target nucleic acids to form detectable target: probe duplex. The present sequence represents a specifically claimed target sequence. Oligonucleotides are useful to detect HPV Type 16 and/or 18 in samples e.g. cervical smears, body fluid, and distinguish these from other HPV variants. Papillomaviruses are small DNA viruses and HPV Types 16 and/or 18 are associated with genital cancers. HPV PCP primers can amplify HPV Type 16 and/or 18 nucleic acid in a sample. HPV Type 16 and/or 18 can be detected by adding a probe and detecting probe; target duplex formation; target nucleic acid is optionally amplified. Type 16 or 18 can be specifically detected by amplifying nucleic acids with at least one specifically claimed PCP primer. For Type 18 detection, a helper probe may be used. Oligonucleotides can distinguish target sequences from phylogenetically close HPV Types 16 and 18 whilst available detection serve the phylogenetically close HPV Types 16 and 18 whilst available detection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Query Match
